

APPROVAL CITY & SOUTHWEST ACOUSTICS ADVISOR

| Review of: | Barangaroo Metro Station Noise & Vibration Monitoring Report September 2021 to March 2022 | Document reference: | SMCSWSBR-BWC-SBR-EM- REP-003986 |
|-------------------|--|---------------------|------------------------------------|
| Prepared by: | Acoustics Advisor | | Version 01 |
| Date of issue: | 1 September 2022 | | 23 August 2022 |

As approved Acoustics Advisor for the Sydney Metro City & Southwest project, I have reviewed and provided comment on the Noise and Vibration Monitoring Report September 2021 to March 2022 for the Barangaroo Metro Station, as required under A27 (d) of the project approval conditions.

This report is to be submitted to the NSW Department of Planning and Environment in accordance with Condition of Approval C16 and the Barangaroo Metro Station Construction Noise and Vibration Management Plan (CNVMP).

I have reviewed the report and am satisfied that my comments have been adequately addressed and that it meets the requirements of the Barangaroo Metro Station CNVMP. I endorse the report.

Note: A controlled copy of the Noise and Vibration Monitoring Report will be distributed to the Sydney Metro Principal's Representative, Environmental Representative (ER), the Acoustic Advisor (AA) and other nominated stakeholders, and it will be made available to all BR COP employees and subcontractors in soft copy format through the project document control system.

This document, when printed, will be uncontrolled and it will the responsibility of each user to confirm the currency of the plan through the project document control system.

1. Introduction

The Sydney Metro City & Southwest Project is a 30-kilometre metro railway between Chatswood and Bankstown including 17 kilometres of new tunnels from Chatswood to Sydenham travelling under Sydney Harbour connecting 7 new underground stations at Crows Nest, Victoria Cross (North Sydney), Barangaroo, Pitt Street, Martin Place, Central and Waterloo. Upgrading 13 kilometres of the Bankstown line including 11 existing stations at Sydenham, Marrickville, Dulwich Hill, Hurlstone Park, Canterbury, Campsie, Belmore, Lakemba, Wiley Park, Punchbowl and Bankstown plus service facilities.

BESIX Watpac have been engaged by Sydney Metro to build the Barangaroo Station Construct Only Package (BR COP), forming part of the broader Sydney Metro City & Southwest Chatswood to Sydenham project.

The project site is located North of the Barangaroo precinct below Hickson Road on the North-western edge of the Sydney CBD and adjacent to Nawi Cove as shown in Figure 1. The station is the most northerly of the CBD stations.

Figure 1 - Location of Barangaroo Station

2. Purpose

This Noise and Vibration Management Report (NVMR) is a summary of all noise and vibration monitoring conducted over the 6-month period from the commencement of Construction on 16th September 2021 to 15th March 2022.

The Noise and Vibration Management Plan (CNVMP) outlines in Appendix E a Construction Noise and Vibration Monitoring Program which details the monitoring required by Condition of Approval (CoA) C10 and the frequency of reporting. The Construction Noise and Vibration Monitoring Program has been endorsed by the Acoustic Advisor (AA) and approved by the Secretary in accordance with CoA C13.

CoA C16 required the results of the monitoring program to be provided to the Secretary for information at the frequency identified in the program. The approved monitoring program states that the details of the noise and vibration monitoring will be reported on a six-monthly basis.

The independent Acoustic Advisor will be provided the report for endorsement prior to submission to the Secretary for information by Sydney Metro.

The applicable CoAs are shown in Table 1 below:

| Condition | | Reference |
|-----------|---|---|
| C9 | The following Construction Monitoring Programs must be prepared in consultation with the relevant government agencies identified for each Construction Monitoring Program to compare actual performance of construction of the CSSI against predicted performance. Required Construction Monitoring Programs and (Relevant government agencies to be consulted for each Construction Monitoring Program) Noise and Vibration (EPA and Relevant Council(s) Blasting (EPA and Relevant Council(s)) Water Quality – (EPA and Relevant Council(s)) Groundwater – (DPI Water) | Noise and Vibration – refer to the Construction Noise and Vibration Management Plan Blasting – Not applicable (Appendix A Staging Report) Water Quality – Not applicable (Appendix A Staging Report) Groundwater – Not applicable (Appendix A – Staging Report) |
| C16 | The results of the Construction Monitoring Programs must be submitted to the Secretary for information, and relevant regulatory agencies, for information in the form of a Construction Monitoring Report at the frequency identified in the relevant Construction Monitoring Program | This report |

3. Construction Activities

Construction activities occurring on site during the reporting period have compromised the following:

- Deliveries
- Demolition of existing temporary steel and concrete access bridges
- Civil works including the installation of a stormwater trunk main, HV cabling and utility services installations
- Waterproofing of the roof of the station box
- Fit-out of the station box including services reticulation, installation of escalators, structural steelwork, precast concrete platform elements and blockworks walls

3.1 Standard Construction Hours

Construction has been carried out in accordance with the hours as outlined in CoA E36 as follows:

- 07.00am to 6:00pm Mondays to Fridays, inclusive
- 08.00am to 1.00pm Saturdays; and
- At no times on Sundays or public holidays

3.2 Out of Hours Construction Summary

Construction has been undertaken out of hours under CoA E44 and E47 under the approved Out of Hours Works Applications (OOHWA) listed in Table 2:

| OOHWA | Works description | Approval | Approved Duration |
|-----------|------------------------------|----------|-------------------------------------|
| OOHW-001 | Deliveries | E48 | September 2021 – December 2022 |
| OOHWA-002 | Station Works | E48 | October 2021 – June 2022 |
| OOHWA-003 | Civil works – bridge jacking | E44(d) | October 2021 – November 2021 |
| OOHWA-004 | High voltage installation | E44(f) | October 2021 – November 2021 |
| OOHWA-005 | Ausgrid pit investigation | E44(f) | 14 November 2021 – 15 November 2021 |
| OOHWA-006 | Civil Works Hickson Road | E44(f) | December 2021 – May 2022 |

 Table 2 Approved Out of Hours Applications

3.3 Emergency Construction

Construction has been carried out as emergency construction in accordance with CoA E44b on one occasion during the reporting period. The hoist used as an emergency egress route out of the cross-over cavern was faulty and needed to be replaced to ensure emergency egress into / out of the station be always maintained. The works took place on 16/10/21 and 17/10/21. The Acoustic Advisor and Environmental representative were notified in accordance with CoA E45 and an Emergency Works report produced to satisfy Section 4.4 of the *Sydney Metro City & Southwest Out of Hours Work Strategy / Protocol.*

4. Monitoring Criteria

4.1 Noise Monitoring Criteria

The following noise parameters are required to be measured when assessing construction noise levels:

- LA1(1minute) The typical 'maximum noise level for an event', used in the assessment of potential sleep disturbance during night-time periods. Alternatively, assessment may be conducted using the LAmax or maximum noise level.
- LAeq(15minute) The "energy average noise level" evaluated over a 15-minute period. This parameter
 is used to assess the potential construction noise impacts and to assess compliance with the relevant
 internal or external NMLs
- LA90 The "background noise level" or Rating Background Level" (RBL) in the absence of construction activities. This parameter represents the average minimum noise level during the daytime, evening and night-time periods respectively. The LAeq (15 minute) construction noise management levels (NMLs) are based on the RBLs.
- The subscript "A" indicates that the noise levels are filtered to match normal hearing characteristics (A weighted)

The NSW EPA Interim Construction Noise Guideline (ICNG) requires project specific Noise Management Levels (NMLs) to be established for noise affected receivers. Two site-specific Construction Noise and Vibration Impact Statements (CNVISs) has been prepared in accordance with CoA E33. Each CNVIS was prepared prior to the commencement of construction before noise and vibration impacts commenced and included specific mitigation measures adopted and predict noise impacts to nearby sensitive receivers. One CNVIS has been prepared for above-ground civil and landscaping construction activities (Civil CNVIS) and a second for construction activities taking place within the station box itself (Station CNVIS). In the event construction noise levels are predicted to be above the NMLs, all feasible and reasonable work practices are investigated to minimise noise emissions.

Environmental noise monitoring (excluding spot checks of plant and equipment) have been recorded over 15-minute sample intervals, excluding periods of extraneous noise until a representative sample has been obtained. A representative sample will be determined by the operator, who will be competent, suitability trained and experienced in undertaking noise measurements and familiar with the relevant Australian Standards.

For spot checks of noise intensive plant and equipment, duration of monitoring will depend on the source of noise being monitored. Sources of continuous noise (such as generators or fans), measurements will be monitored over one-to-two-minute intervals. For dynamic plant, such as front-end loaders, spot checks will capture a representative activity, such as one truck-and-trailer load cycle

Table 3 below which is reproduced from Addendum A of Sydney Metro CNVS sets out the internal noise criteria for residential and other sensitive receivers. The Barangaroo Metro station falls within an Identified Precinct in accordance with CoA E37.

| Area | Receiver Type | Approved Condition | Time Period | Criteria (internal) ⁴ |
|-----------------------------------|---------------|-----------------------|-------------|---|
| Identified Precincts ¹ | All | E38 | 7am to 8pm | Noise levels are required to be less than LAeq (15 minute) 60 dB(A) for at least 6.5 hours between 7am and 8pm, of which at least 3.25 hours must be below LAeq (15 minute) 55 dB(A). |
| | | | | Noise equal to or above LAeq (15 minute) 60 dB(A) is allowed for the remaining 6.5 hours between 7am and 8pm. ³ |

Table 3 Internal construction noise criteria levels (Conditions of Approval)

| Area | Receiver Type | Approved Condition | Time Period | Criteria (internal)⁴ |
|---------------------------------------|---------------|-----------------------|--------------------------|--|
| Non-residential zones ² | Residential | E41 | 8pm to 9pm 9pm to 7am | LAeq (15 minute) 60 dB(A) LAeq (15 minute) 45 dB(A) |
| Residential zones ² | Residential | E42 | 8pm to 7am | LAeq (15 minute) 45 dB(A) |
| All | All | E43 | All | LAeq (8 hour) 85 dB(A) (external) near the CSSI |

Notes:

- 1.) Identified precincts are provided in CoA E37 and include Crows Nest, Victoria Cross, Barangaroo, Martin Place and Pitt Street
- 2.) These are identified by the applicable Local Environmental Plan land zoning of the receiver
- 3.) Criteria as described in CoA E38
- 4.) A 5 dB penalty shall be applied if rock breaking or any other annoying activity likely to result in ground-borne noise or a perceptible level of vibration is planned

4.2 Vibration Monitoring Criteria

The following vibration screening criterial have been applied:

- Reinforced or frame structures 25.0mm/s
- Unreinforced or light framed structures 7.5mm/s
- Heritage structures⁵ 2.5mm/s

Notes:

5.) If a heritage structure is predicted to be exposed to vibration levels above the conserva ive vibra ion screening level of 2.5mm/s, further investigation would be undertaken to determine whether the structure is structurally sound.

5. Methodology

The Construction Noise and Vibration Monitoring Program is designed to compare actual performance of construction of the CSSI against predicted performance and to assess the effectiveness of the mitigation measures applied during construction of the Project. The program has been executed in accordance with Appendix E of the CNVMP. The Construction Monitoring Program commenced 16 September 2021 at Construction commencement and will continue for the duration of the project.

5.1 Monitoring Locations

Real-time noise and vibration monitors have been established on site, based on the recommendations of the acoustic engineer Renzo Tonin, and as shown in the Construction Noise and Vibration Management Plan (CNVMP).

The positions of noise and vibration monitors are shown below in Figure 2.

Figure 2 – Location of on-site Noise and Vibration monitors

5.2 Monitoring Equipment

The monitors used for the various monitoring completed during the reporting period are outlined in Table 4 below. Attended monitors were field calibrated before each field measurement

| Table 4 - | Monitoring | Equipment | Details |
|-----------|------------|-----------|---------|
|-----------|------------|-----------|---------|

| Equipment Details | Monitoring Type | Location | Serial No. |
|----------------------|-----------------|--|------------|
| SiteHive Hexanode 85 | Real-time noise | On site, 40 metres to the south of 25 Hickson Road, Barangaroo | 000085 |

| Equipment Details | Monitoring Type | Location | Serial No. |
|-------------------|-----------------------------|--------------------------------|--------------|
| Sigicom Infra C22 | Real-time vibration monitor | 25 Hickson Road, Barangaroo | 106847 |
| Rion NL-42 | Attended noise | Various | 00469907 |
| Rion NL-52 | Attended noise | Various | 00553919 |
| NTI-XL2 | Attended noise | Various | A2A-20373-E0 |
| NTI-XL2 | Attended noise | Various | A2A-05642-E0 |

5.3 Monitoring Results

5.3.1 Attended vibration monitoring summary

Attended vibration monitoring was not required during the reporting period. Vibration within 25 Hickson Road was monitored in real-time, as discussed below.

5.3.2 Attended noise monitoring summary

5.3.3 Attended noise monitoring

Attended noise monitoring results are summarised in Table 5 below:

Table 5 Attended noise monitoring results

| Location / Receiver | Date | Main Activities | Noise Period | Noise Management Level (NML) dB(A) LAeq 15 minute | RBL | Predicted Noise Level | Measured External LAeq 15 minute | Measured External LA max (LA01 min) | Exceedance of NML LAeq 15 minute | Exceedance of RBL LAeq 15 minute | Difference to predicted Level | Comment |

5.3.4 Real-time vibration monitoring summary

Vibration monitoring data for the Barangaroo Metro station has been based on real-time monitoring results as these are considered to best represent the most impacted structure, being 25 Hickson Road, and group of receivers, being the personnel working within 25 Hickson road as this is the closest heritage structure, at risk of cosmetic damage per CoA e29, in the vicinity of the works. Vibration data for 25 Hickson Road for the reporting period is included below in Appendix C. The vibration monitor is located on the ground floor of the building, see Figure 3 below, mounted to an external wall nearest to where civil construction activities will occur. A single exceedance of the screening criteria occurred, as shown below in Table 6 which was confirmed to be a false alarm triggered by the monitor being bumped.

Date Monitor Location Recorded vibration Screening Level Investigation results (mm/s) (mm/s) 8.4 7.5 23/02/2022 25 Hickson Road, The monitor was bumped when a Barangaroo piece of electrical equipment was lent against it.

No exceedances were identified caused by BR COP works.

| Table 6 | Recorded | exceedances | vibration | monitor |
|---------|----------|--------------|-----------|---------|
| Tuble 0 | necoraca | CACCCUUTICCO | VINIGUOII | monitor |

Figure 3 – On site real-time vibration monitor at 25 Hickson Road

5.3.5 Real-time noise monitoring summary

CoA E37 requires that receivers be identified who are likely to experience internal noise levels greater than Leq 15 minute 60 dB(A) inclusive of a 5 dB penalty, if rock breaking or any other annoying activity likely to results in regenerated (ground-borne) noise or a perceptible level of vibration is planned, between 7am – 8pm at Barangaroo. These receivers are listed in the CNVIS for above ground Civil Works in Appendix D.2 of the CNVIS

CoA E38 requires that between the hours of 7am and 8pm, the following internal noise criteria apply:

- Criteria 1a Noise levels be less than Leq 15 minute 60 dB(A) for at least 6.5 hours
- Criteria 1b Noise levels be less than Leq 15 minute 55 dB(A) for 3.25 hours
- Criteria 2 Noise level can be above Leq 15 minute 60 dB(A) for 6.5 hours

The condition also requires that consultation be undertaken with the receivers identified in CoA E37 with the objective of determining appropriate hours of respite so that construction noise (including ground-borne noise, does not exceed the internal noise levels described above.

Consultation in relation to CoA E38 has been undertaken and documented in the CNVMP and Civil CNVIS in Appendix D. Consultation with receivers is documented in Section 4.1.2. BESIX Watpac have carried out consultation with the following community organisations, to agree respite periods:

- The Millers Point Residents Action Group
- The Walsh Bay Precinct association
- KU Lance Children's Centre, Miller's Point
- The Langham Hotel, Miller's Point

It has been agreed with the above groups that the same respite periods as were adopted by the preceding TSE Contractor, who carried out the excavation of the station box, be adopted by the BR Contractor. These respite periods are between **09.30am to 10.30am and 12.30pm to 1.30pm** Monday to Friday.

To monitor compliance with CoA E38 and the requirement that between 7am and 8pm Noise levels be less than Leq 15 minute 55 dB(A) for 3.25 hours (Criteria 1b) the following should be considered:

- The hours worked on site are between 7am and 6pm Monday to Friday so each day there are at least 2 hours (6pm to 8pm) where no construction activities take place and the noise levels generated by default are less than Leq 15 minute 55 dB(A).
- The hours worked on Saturdays are 08.00am to 1.00pm, so each Saturday there are at least 8 hours where no construction activities take place and the noise levels generated by default are less than Leq 15 minute 55 dB(A).
- No works tale place on Sundays, or public holidays.
- The BR Contractor implements a noise respite period each day (Mon Fri) between 09.30am to 10.30am and 12.30pm to 1.30pm meaning that for 2 hours during the day noise levels generated on site are less than Leq 15 minute 55 dB(A).

In total, the noise levels generated by construction activities between 7am and 8pm occurring on site will be less than Leq 15 minute 55 dB(A) for at least 4 hours between Monday to Friday, 8 hours on Saturdays and 13 hours on Sundays and Public Holidays due to the construction hours worked and respite periods implemented.

To verify this and to monitor compliance with Criteria 1a (that noise levels be less than Leq 15 minute 60 dB(A) for at least 6.5 hours) and Criteria 1b (that noise levels be less than Leq 15 minute 55 dB(A) for 3.25 hours), the number of 15 minute periods between 7am and 8pm that internal noise levels were observed to be above 60dBa (Leq 15minute) and below 55dBA, respectively have been counted. Within these periods

works are allowed to generate noise levels above 60dBA for 6.5 hours (26 x 15-minute periods) and must be below 55dBA for at least 3.25 hours (13 x 15 minute periods).

Real-time monitoring results for September 2021 to March 2022 are included in Appendix A. The real-time noise monitor is located externally so a conservative 20dB(A) noise reduction has been applied to compare the measured noise levels at the real-time monitor with internal E38 noise levels. This reduction contemplates a 10dB reduction for façade loss, given the nearest receivers are Heritages houses, a 5dB reduction for the screening provided by the Hickson Road Wall and a 5dB reduction for the >45 metre distance from the monitor to the nearest receiver. The results of the daily real-time noise monitoring carried out for the reporting period show that Criteria 1a and Criteria 1b requirements were not observed to have been exceeded during the reporting period demonstrating compliance with CoA E38.

6. Conclusion

Observed noise and vibration levels are generally in accordance with, or below, the forecasts presented in the Construction Noise and Vibrations Impact Statements (CNVIS), or noise impact assessments prepared for Out of Hours Works applications (OOHWA).

Based on the monitoring results and site investigations, noise and vibration associated with the construction activities being undertaken at the BR COP was compliant with the project approvals and requirements during the monitoring period.

Accredited for compliance with ISO/IEC 17025 - Calibration

Results of the tests, calibration and/or measurements included in this document are traceable to SI units through reference equipment that has been calibrated by the Australian National Measurement Institute or other NATA accredited laboratories demonstrating traceability.

This report applies only to the item identified in the report and may not be reproduced in part. The uncertainties quoted are calculated in accordance with the methods of the ISO Guide to the Uncertainty of Measurement and quoted at a coverage factor of 2 with a confidence interval of approximately 95%.

The performance characteristics listed below were tested. The tests are based on the relevant clauses of IEC 61672-3:2013

| Tests Performed: | Clause | Result |
|---------------------------------|--------|----------------|
| Absolute Calibration | 10 | Pass |
| Acoustical Frequency Weighting | 12 | Pass |
| Self-Generated Noise | 11.1 | Observed |
| Electrical Noise | 11.2 | Observed |
| Long Term Stability | 15 | Pass |
| Electrical Frequency Weightings | 13 | Pass |
| Frequency and Time Weightings | 14 | Pass |
| Reference Level Linearity | 16 | Pass |
| Range Level Linearity | 17 | Not Applicable |
| Toneburst | 18 | Pass |
| Peak C Sound Level | 19 | Pass |
| Overload Indicator | 20 | Pass |
| High Level Stability | 21 | Pass |

Statement of Compliance: The sound level meter submitted for testing successfully completed the periodic tests of IEC 61672-3:-2013, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:-2013 because evidence was not publically available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:-2013 and because the periodic tests of IEC 61672-3:-2013 cover only a limited subset of the specifications in IEC 61672-1:-2013.

A full technical report is available on request.

Traceability

The results of the tests and measurements included in this document are traceable via the test methods described under each test, and by the use of the above equipment, which has been calibrated by NATA accredited calibration facilities. This document shall not be reproduced, except in full.

Scope scope This certificate is issued on the basis that the instrument complies with the manufacturer's specification. See "Sound Level Meter Verification - Summary of Tests" page for an itemised list of results for each test.

Uncertainty The uncertainty is stated at a confidence level of 95% using a k factor of 2.

Calibration Statement

The sound level meter submitted for testing has successfully completed the periodic tests of IEC 61672-3 2013 and EC 61260-3:2016, for the environment conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:2013 and EC 61260-1:2014 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:2013 and EC 61260-1:2014 or correction data for acoustical test of frequency weighting were not provided in the Instruction Manual and (b) because the periodic tests of EC 61672-3 2013 and EC 61260-3:2016 cover only a limited subset of the specifications in IEC 61672-1:2013 and EC 61260-1 2014.

Descriptions of Tests

1(b). Acoustical signal tests of a frequency weighting (IEC 61672-3)

(Clause 12.2)

Correction data shall account for:

- the equivalent free-field or random-incidence frequency response of the sound level meter if the source of sound or simulated sound is the pressure field in a multi-frequency sound calibrator, in a comparison coupler, or from an electrostatic actuator; and,

- if applicable, the average influence on the frequency response of a typical microphone of a windscreen and any accessories that are part of the configuration of the sound level meter for normal use.

(Clause 12.3)

Correction data shall be obtained from tables in the Instruction Manual for the sound level meter.

(Clause 12.4)

If the necessary correction data are not available from the Instruction Manual, data from the manufacturer of the microphone, multi-frequency sound calibrator, comparison coupler, or electrostatic actuator may then be used. This data shall be publicly available

(Clause 12.5)

The source for the free-field or random-incidence correction data shall be stated in the documentation for the results of the periodic tests. The source for the associated uncertainties of measurement shall be the same as the source for the corresponding correction data. If the uncertainties of the corresponding free-field correction data are not available, the applicable maximum-permitted uncertainties given in IEC 62585 shall be used in the calculation of the laboratory's total uncertainty budget.

NOTE: Where the uncertainties due to the "Mic FF to Pressure", "Case" or "Windscreen" are omitted in the table above, the following statement applies:

No information on the uncertainty of measurement, required by IEC 61672-3:2013, for the correction data given in the Instruction Manual or obtained from the manufacturer or supplier of the sound level meter, or the manufacturer of the microphone, or the manufacturer of the multi-frequency sound calibrator was provided in the Instruction Manual or made available by the manufacturer or supplier of the sound level meter. The uncertainty of measurement of the correction data was therefore assumed to be the maximum-permitted uncertainty given in IEC 62585 for the corresponding free-field correction data and for a coverage probability of 95 %.

Descriptions of Tests

1(c). Acoustical signal tests of a frequency weighting (IEC 61672-3)

(Clause 13.6)

For each frequency weighting and at each test frequency, corrections shall be applied to the relative frequency weightings determined in 13.5 to account for:

- the deviation of the free-field or random-incidence frequency response of the microphone in the reference direction from a uniform frequency response;

- the average effects of reflections from the case of the sound level meter and of diffraction of sound around the microphone and preamplifier; and,

- if applicable, the average influence on the frequency response of a typical microphone of a windscreen and any accessories that are part of the configuration of the sound level meter for normal use.

(Clause 13.7)

Corrections for the effects of reflections and diffraction and for the influence of the windscreen and windscreen accessories on the free-field or random-incidence frequency response shall be the same as used for the frequency-weighting tests with acoustical signals.

NOTE: Where the uncertainties due to the "Mic FF to Pressure", "Case" or "Windscreen" are omitted in the table above, the following statement applies:

No information on the uncertainty of measurement, required by IEC 61672-3:2013, for the correction data given in the Instruction Manual or obtained from the manufacturer or supplier of the sound level meter, or the manufacturer of the microphone, or the manufacturer of the multi-frequency sound calibrator was provided in the Instruction Manual or made available by the manufacturer or supplier of the sound level meter. The uncertainty of measurement of the correction data was therefore assumed to be the maximum-permitted uncertainty given in IEC 62585 for the corresponding free-field correction data and for a coverage probability of 95 %.

Descriptions of Tests

2. Preliminary Inspection and Power Supply (IEC 61672-3 Clause 5 "Preliminary Inspection" & Clause 6 "Power Supply") Prior to any measurements, the sound level meter and all accessories shall be visually inspected, paying particular attention to damage to, or accumulation of foreign material on, the protection grid or diaphragm of the microphone. All relevant controls shall be operated to

ensure that they are in working order. If the controls, display, and other essential elements are not in proper working order, no periodic tests shall be performed.

For all tests, the sound level meter shall be powered from its preferred supply or a suitable alternative. Before and after conducting the set of tests with acoustical signals and before and after conducting the set of tests with electrical signals, the power supply for the sound level meter shall be checked by the method stated in the Instruction Manual to ensure that it is within the specified operating limits. If the voltage or the equivalent indication of the status of the power supply is not within the operating limits and the reason cannot be attributed to partially discharged batteries or an incorrect selection of the voltage of the public power supply, then no periodic tests shall be performed as a malfunction is indicated.

3. Environmental conditions (IEC 61672-3 Clause 7 "Environmental Conditions") Periodic tests shall be performed within the following ranges of environmental conditions: 80 kPa to 105 kPa for static air pressure, 20 °C to 26 °C for air temperature and 25 % to 70 % for relative humidity. These conditions are recorded at the start and end of the testing

4a. Calibration (IEC 61672-3 Clause 10 "Indication at the calibration check frequency") The sound level meter shall be adjusted, if necessary, to indicate the required sound level for the environmental conditions under which the tests are performed. The indications of the sound level meter before and after adjustment shall be recorded.

4b. Long-term Stability (IEC 61672-3 Clause 15) The long-term stability of a sound level meter is evaluated from the difference between the A-weighted sound levels indicated in response to steady 1 kHz signals applied at the beginning and end of a period of operation. For each indication, the level of the input signal shall be that which is required to display the reference sound pressure level on the reference level range for the first indication.

The period of continuous operation shall be between 25 min and 35 min during which any convenient set of tests that use electrical input signals are performed.

The measured difference between the initial and final indications of A-weighted sound level shall not exceed the acceptance limits given in IEC 61672-1.

Descriptions of Tests

5(a) Self-Generated Noise, Microphone Installed (IEC 61672-3 Clause 11.1)

Measurements of the level of self-generated noise shall be made in a location that is available to the testing laboratory and where the level of background noise is minimized. Any supplied windscreen and windscreen accessory need not be installed around the microphone for measurement of the level of self-generated noise. The sound level meter shall be in the configuration submitted for periodic testing and with the most-sensitive level range and frequency-weighting A selected.

The indicated level of the A-weighted self-generated noise on the most-sensitive level range shall be recorded and reported. The level of selfgenerated noise is preferably measured as a time-averaged sound level with an averaging time of at least 30 s. Time-averaged sound level may be measured directly or calculated from an indication of sound exposure level and integration time. If time-averaged sound level cannot be determined, the time-weighted sound level from the average of ten observations taken at random over a 60 s interval shall be measured. If the time-weighted sound level is recorded, the S time weighting shall be used if available; otherwise the F time weighting shall be used.

5(b) Self-Generated Noise - Electrical (IEC 61672-3 Clause 11.2)

With the microphone replaced by the electrical input-signal device (or using the specified means of inserting electrical signals), and with the device terminated in the manner specified in the Instruction Manual for measurements of the level of self-generated noise, the indicated level of the time-averaged or time-weighted self-generated noise, measured by the same procedure as with the microphone installed, shall be recorded and reported for all frequency weightings and for the most-sensitive level range.

Description of Tests

6. Acoustical signal tests of a frequency weighting (IEC 61672-3 Clause 12) The sound level meter shall be set for frequency-weighting C, if available, otherwise for frequencyweighting A. The frequency weighting for tests with acoustical signals shall be determined at 125 Hz, 1 kHz, and 8 kHz. However, for information, this laboratory tests from 31.5Hz to 16kHz.

For frequency-weighting tests using a multi-frequency sound calibrator, the sound pressure level in the coupler of the sound calibrator shall preferably be set to the reference sound pressure level at 1 kHz, but shall be in the range from 70 dB to 125 dB at all frequencies.

At the discretion of the laboratory, the sound level meter shall be set to measure F-timeweighted sound level or S-time-weighted sound level. As a minimum, two repetitions of the coupling and measurements shall be performed to give a total of at least three tests.

The relative frequency weighting, relative to the response at 1 kHz, shall be determined from the average equivalent free-field or random-incidence sound level at a test frequency minus the average equivalent free-field or random-incidence sound level at 1 kHz. (Clause 12.15)

Description of Tests

7. Electrical signal tests of frequency weightings (IEC 61672-3 Clause 13) Frequency weightings shall be determined using steady sinusoidal electrical input signals for all frequency weightings for which design goals and acceptance limits are specified in IEC 61672-1 and which are provided in the sound level meter. The sound level meter shall be set to display F-time-weighted sound level.

On the reference level range and for each frequency weighting to be tested, the level of a 1 kHz input signal shall be adjusted to yield an indication that is 45 dB less than the upper boundary stated in the Instruction Manual for the linear operating range at 1 kHz on the reference level range.

At test frequencies other than 1 kHz, the level of the input electrical signal shall be determined as the level of the input signal at 1 kHz minus the exact design-goal response, given in IEC 61672-1 for the selected frequency weighting at the test frequency.

Description of Tests

9(a). Level linearity on the reference level range (IEC 61672-3 Clause 16)

Level linearity shall be tested with steady sinusoidal electrical signals at a frequency of 8 kHz with the sound level meter set for frequency-weighting A. (61672-3 Clause 16.1).

Level linearity shall be measured in 5 dB steps of increasing input signal level from the starting point up to within 5 dB of the upper boundary stated in the Instruction Manual for the linear operating range at 8 kHz, then at 1 dB steps of increasing input signal level up to, but not including, the first indication of overload. The test of level linearity shall then be continued at 5 dB steps of decreasing input signal level from the starting point down to within 5 dB of the specified lower boundary, then at 1 dB steps of decreasing input signal level from the starting number of an under-range condition.

Measured level linearity deviations shall not exceed the applicable acceptance limits given in IEC 61672-1 from the specified upper boundary of the linear operating range up to, but not including, the first indication of overload and also from the specified lower boundary of the linear operating range down to, but not including, the first indication of an under-range condition.

"Y" means indicator over-range.

Description of Tests

0.13

10. Level linearity including the level range control (IEC 61672-3 Clause 17)

For sound level meters that have more than one level range, tests of level linearity errors including errors introduced by the level range control shall be performed with steady sinusoidal electrical input signals at a frequency of 1 kHz and with the sound level meter set for frequency weighting A. For each test, signal levels shall be recorded as indications of F-time-weighted sound level or time-average sound level. (61672-3 Clause 17.1).

With the input signal level kept constant, the indicated signal level shall be recorded for all level ranges where the signal level is displayed. The indicated signal levels and the corresponding anticipated indications of signal levels shall be recorded. (61672-3 Clause 17.3).

For each level range, the level of the input signal shall then be adjusted to yield a signal level that is expected to be 5 dB greater than the signal level that first causes an indication of under-range on a level range. The indicated signal levels and the corresponding anticipated levels shall be recorded. (61672-3 Clause 17.4).

Level linearity deviations shall be calculated as an indicated signal level minus the corresponding anticipated signal level. Measured level linearity deviations shall not exceed the applicable acceptance limits given in IEC 61672-1.

| Description of Tests | | | | | | | |
| 12. Peak C sound leve | el (IEC 61672 | -3 Clause 19 |) | | | | |
| Indications of C-weighted peak sound level shall be tested on the least-sensitive level range. The test signals consist of (a) a single complete cycle of an 8 kHz sinusoid starting and stopping at zero crossings and (b) positive and negative half cycles of a 500 Hz sinusoid that also start and stop at zero crossings. | | | | | | | |
| The level of the steady sinusoidal 8 kHz electrical input signal, from which a single complete cycle is extracted, shall be adjusted to yield an indication of C-weighted, F-timeweighted sound level, or C-weighted, time-averaged sound level, that is 8 dB less than the upper boundary stated in the Instruction Manual for the peak level range at 8 kHz on the leastsensitive level range. The indication of feady sound level, shall be recorded. | | | | | | | |

The indication of C-weighted peak sound level in response to a complete cycle of the 8 kHz signal shall be recorded. Application of the complete-cycle 8 kHz signal shall not cause indication of an overload condition.

The level of the steady sinusoidal 500 Hz electrical input signal, from which positive and negative half cycles are extracted, shall be adjusted to yield an indication of C-weighted, Ftime-weighted sound level, or C-weighted, time-averaged sound level, that is 8 dB less than the upper boundary stated in the Instruction Manual for the peak level range on the least-sensitive level range. The indications of steady sound levels shall be recorded.

The indications of C-weighted peak sound level in response to a single positive halfcycle 500 Hz signal and to a single negative half-cycle 500 Hz signal shall be recorded and reported. Applications of the 500 Hz half-cycle signals shall not cause indications of an overload condition.

Description of Tests

14. High-level Stability (IEC 61672-3 Clause 21) The ability of a sound level meter to operate continuously in response to high signal levels without significant change in sensitivity is evaluated from the difference between the Aweighted sound levels indicated in response to a steady 1 kHz electrical signal at the beginning and end of a 5 min period of continuous exposure to the signal.

The level of the steady electrical input signal shall be that which is required to display the sound level that is 1 dB less than the upper boundary of the 1 kHz linear operating range on the least-sensitive level range.

Description of Test

15(a) Octave Filter (IEC 61260-3 Clause 13)

13 Measurement of relative attenuation

13.1 The relative attenuation on the reference level range shall be tested for the same three filters as selected in Clause 11. 13.2 The measurements of relative attenuation are made as the response to constant amplitude sinusoidal signals at various frequencies. The level of the input signals shall be $(1 \pm 0,1)$ dB below the specified upper boundary of the linear operating range.

13.6 The measured relative attenuation shall not exceed the acceptance limits given in Table 1 for the appropriate class of filter.

Interpretation: The three filters specified in "Clause 11" are 31.5Hz, 1kHz and 16kHz. The limits in "Table 1" are the Tolerance values shown in green above. The yellow cells are the observed values. The "Attenuation dB" cells are the attenuation values of each filter with the filter's centre frequency attenuation assumed to be zero (i.e. the relative attenuation). The "Ins Loss" are the actual values of attenuation at the filter centre frequencies.

Description of Test

16. Octave Band Filter Relative Attenuation at Midband Frequency (IEC 61260-3 Clause 10.2)

10.2 Tests of relative attenuation at midband frequency 10.2.1 The relative attenuation at the exact midband frequency shall be measured for every filter in a set of filters. The relative attenuation $\Delta A(\Omega)$ at any midband frequency is determined from Formula (8) given in IEC 61260-1:2014. The reference level range shall be selected for the test. The level of the test signal shall be equal to the reference input signal level.

10.2.2 The measured relative attenuation shall not exceed the acceptance limits ± 0,4 dB for Class 1 filters or ± 0,6 dB for class 2 filters as specified in 5.10 in IEC 61260-1:2014.

Interpretation: The yellow cells are the observed values. The "Ins Loss" are the actual values of attenuation at the filter centre frequencies. The "Conforming" cells demonstrate compliance with the Tolerance limits depending upon the Class of filter.

Description of Tests

17(a). Filter Level linearity on the reference level range (IEC 61260-3 Clause 11)

0.13

The level linearity shall be tested for three filters in a set of filters. For a set of filters covering the audible range of frequencies, it is recommended to test filters with frequencies close to 31.5 Hz,1 kHz and 16 kHz.

The test shall be performed on the reference level range for levels from the specified lower boundary of the specified linear operating range up to a level where the overload indicator displays an overload. Adjust the level of the input signal with steps that are not greater than 5 dB. The difference between successive steps of the input signal level shall be reduced to 1 dB when the distance to the lower or upper boundaries of a linear operating range is less than 5 dB and when the level is above the upper boundary. The boundaries are as stated in the instruction manual for the filter. If no overload is displayed, the filter does not conform to the requirements.

The measured level linearity deviation shall not exceed the acceptance limits given in 5.13 in IEC 61260-1:2014 for all measured levels between the lower boundary of the linear operating range, as stated in the instruction manual for the filter, and up to the highest level, measured as described above, without an overload indication.

An overload shall not be indicated if the level of the input signal is below the stated upper boundary of each appropriate linear operating range.

"Y" means indicator over-range.

Description of Tests

17(b). Filter Level linearity on the reference level range (IEC 61260-3 Clause 11)

The level linearity shall be tested for three filters in a set of filters. For a set of filters covering the audible range of frequencies, it is recommended to test filters with frequencies close to 31.5 Hz,1 kHz and 16 kHz.

The test shall be performed on the reference level range for levels from the specified lower boundary of the specified linear operating range up to a level where the overload indicator displays an overload. Adjust the level of the input signal with steps that are not greater than 5 dB. The difference between successive steps of the input signal level shall be reduced to 1 dB when the distance to the lower or upper boundaries of a linear operating range is less than 5 dB and when the level is above the upper boundary. The boundaries are as stated in the instruction manual for the filter. If no overload is displayed, the filter does not conform to the requirements.

The measured level linearity deviation shall not exceed the acceptance limits given in 5.13 in IEC 61260-1:2014 for all measured levels between the lower boundary of the linear operating range, as stated in the instruction manual for the filter, and up to the highest level, measured as described above, without an overload indication.

An overload shall not be indicated if the level of the input signal is below the stated upper boundary of each appropriate linear operating range.

"Y" means indicator over-range.

Description of Tests

19. Filter Level linearity including the level range control (IEC 61260-3 Clause 11.9)

11.9 For the same three filters as selected above, test each available level range in the following way: based on the same reference level, adjust the input level to be 30 dB below upper boundary of the linear operating range for each of the selected range settings. The measured level linearity deviation shall not exceed the acceptance limits given in 5.13.3 and 5.13.4 of IEC 61260-1:2014

The three filter frequencies are 31.5Hz, 1kHz and 16kHz.

The level linearity differences are calculated as the indicated signal level minus the corresponding expected signal level.

20. Octave Band Filter Lower Llmit (IEC 61260-3 Clause 12)

12.2 Short-circuit the input terminal or use similar means to ensure that the level of the input signal is below the lower limit of the specified linear operating range. Record the output level from each filter in the set. The output level shall not exceed the specified lower limit for the appropriate filter and range.

Interpretation: The yellow cells are the observed values. The measured value must not exceed the Lower Limit for the Range.

Description of Test

21(a) Octave Filter (IEC 61260-3 Clause 13)

13 Measurement of relative attenuation

13.1 The relative attenuation on the reference level range shall be tested for the same three filters as selected in Clause 11.

13.2 The measurements of relative attenuation are made as the response to constant amplitude sinusoidal signals at various frequencies. The level of the input signals shall be (1 ± 0.1) dB below the specified upper boundary of the linear operating range.

13.6 The measured relative attenuation shall not exceed the acceptance limits given in Table 1 for the appropriate class of filter.

Interpretation: The three filters specified in "Clause 11" are 31.5Hz, 1kHz and 16kHz unless the client expands this range. The limits in "Table 1" are the Tolerance values shown in green above. The yellow cells are the observed values. The "Attenuation dB" cells are the attenuation values of each filter with the filter's centre frequency attenuation assumed to be zero (i.e. the relative attenuation). The "Ins Loss" are the actual values of attenuation at the filter centre frequencies.

21(b). Third Octave Band Filter Relative Attenuation (40Hz-315Hz)

Description of Test

21(d) Octave Filter (IEC 61260-3 Clause 13)

13 Measurement of relative attenuation

13.1 The relative attenuation on the reference level range shall be tested for the same three filters as selected in Clause 11.

13.2 The measurements of relative attenuation are made as the response to constant amplitude sinusoidal signals at various frequencies. The level of the input signals shall be (1 ± 0.1) dB below the specified upper boundary of the linear operating range.

13.6 The measured relative attenuation shall not exceed the acceptance limits given in Table 1 for the appropriate class of filter.

Interpretation: The three filters specified in "Clause 11" are 31.5Hz, 1kHz and 16kHz unless the client expands this range. The limits in "Table 1" are the Tolerance values shown in green above. The yellow cells are the observed values. The "Attenuation dB" cells are the attenuation values of each filter with the filter's centre frequency attenuation assumed to be zero (i.e. the relative attenuation). The "Ins Loss" are the actual values of attenuation at the filter centre frequencies.

Description of Test

22. Octave Band Filter Relative Attenuation at Midband Frequency (IEC 61260-3 Clause 10.2)

10.2 Tests of relative attenuation at midband frequency

10.2.1 The relative attenuation at the exact midband frequency shall be measured for every filter in a set of filters. The relative attenuation $\Delta A(\Omega)$ at any midband frequency is determined from Formula (8) given in IEC 61260-1:2014. The reference level range shall be selected for the test. The level of the test signal shall be equal to the reference input signal level.

10.2.2 The measured relative attenuation shall not exceed the acceptance limits \pm 0,4 dB for Class 1 filters or \pm 0,6 dB for class 2 filters as specified in 5.10 in IEC 61260-1:2014.

Interpretation: The yellow cells are the observed values. The "Ins Loss" are the actual values of attenuation at the filter centre frequencies. The "Conforming" cells demonstrate compliance with the Tolerance limits depending upon the Class of filter.

Description of Tests

23(a). Filter Level linearity on the reference level range (IEC 61260-3 Clause 11)

The level linearity shall be tested for three filters in a set of filters. For a set of filters covering the audible range of frequencies, it is recommended to test filters with frequencies close to 31.5 Hz,1 kHz and 16 kHz.

The test shall be performed on the reference level range for levels from the specified lower boundary of the specified linear operating range up to a level where the overload indicator displays an overload. Adjust the level of the input signal with steps that are not greater than 5 dB. The difference between successive steps of the input signal level shall be reduced to 1 dB when the distance to the lower or upper boundaries of a linear operating range is less than 5 dB and when the level is above the upper boundary. The boundaries are as stated in the instruction manual for the filter. If no overload is displayed, the filter does not conform to the requirements.

The measured level linearity deviation shall not exceed the acceptance limits given in 5.13 in IEC 61260-1:2014 for all measured levels between the lower boundary of the linear operating range, as stated in the instruction manual for the filter, and up to the highest level, measured as described above, without an overload indication.

An overload shall not be indicated if the level of the input signal is below the stated upper boundary of each appropriate linear operating range.

"Y" means indicator over-range.

Description of Tests

23(c). Level linearity on the reference level range (IEC 61672-3 Clause 16)

Level linearity shall be tested with steady sinusoidal electrical signals at a frequency of 8 kHz with the sound level meter set for frequency-weighting A. (61672-3 Clause 16.1).

Level linearity shall be measured in 5 dB steps of increasing input signal level from the starting point up to within 5 dB of the upper boundary stated in the Instruction Manual for the linear operating range at 8 kHz, then at 1 dB steps of increasing input signal level up to, but not including, the first indication of overload. The test of level linearity shall then be continued at 5 dB steps of decreasing input signal level from the starting point down to within 5 dB of the specified lower boundary, then at 1 dB steps of decreasing input signal level from the starting number of an under-range condition.

Measured level linearity deviations shall not exceed the applicable acceptance limits given in IEC 61672-1 from the specified upper boundary of the linear operating range up to, but not including, the first indication of overload and also from the specified lower boundary of the linear operating range down to, but not including, the first indication of an under-range condition.

"Y" means indicator over-range.

Description of Tests

24(b). Level linearity on the reference level range (IEC 61672-3 Clause 16)

Level linearity shall be tested with steady sinusoidal electrical signals at a frequency of 8 kHz with the sound level meter set for frequency-weighting A. (61672-3 Clause 16.1).

Level linearity shall be measured in 5 dB steps of increasing input signal level from the starting point up to within 5 dB of the upper boundary stated in the Instruction Manual for the linear operating range at 8 kHz, then at 1 dB steps of increasing input signal level up to, but not including, the first indication of overload. The test of level linearity shall then be continued at 5 dB steps of decreasing input signal level from the starting point down to within 5 dB of the specified lower boundary, then at 1 dB steps of decreasing input signal level from the first indication of an under-range condition.

Measured level linearity deviations shall not exceed the applicable acceptance limits given in IEC 61672-1 from the specified upper boundary of the linear operating range up to, but not including, the first indication of overload and also from the specified lower boundary of the linear operating range down to, but not including, the first indication of an under-range condition.

"Y" means indicator under-range. However, if 20dB above noise floor is reached then no results are reported.

Description of Tests

25. Filter Level linearity including the level range control (IEC 61260-3 Clause 11.9)

11.9 For the same three filters as selected above, test each available level range in the following way: based on the same reference level, adjust the input level to be 30 dB below upper boundary of the linear operating range for each of the selected range settings. The measured level linearity deviation shall not exceed the acceptance limits given in 5.13.3 and 5.13.4 of IEC 61260-1:2014

The three filter frequencies are 31.5Hz, 1kHz and 16kHz.

The level linearity differences are calculated as the indicated signal level minus the corresponding expected signal level.

26. Third Octave Band Filter Lower LImit (IEC 61260-3 Clause 12)

12.2 Short-circuit the input terminal or use similar means to ensure that the level of the input signal is below the lower limit of the specified linear operating range. Record the output level from each filter in the set. The output level shall not exceed the specified lower limit for the appropriate filter and range.

Interpretation: The yellow cells are the observed values. The measured value must not exceed the Lower Limit for the Range.
